

## Trench Rollers

### Rammax 1515

The skid steered trench rollers produced by Rammax are developed for various applications on heavy terrains. Turning on spot and compaction around shafts without annoying routing. Different engine types, hydrostatic drives and different steering systems for highest operator safe and compaction output. Two different working widths and profiles allows perfect compaction even on cohesive soils. Thanks to charging of the IR-Transmitter by solar panels the machines are always ready for operation, even in complete darkness. A combination of hydrostatic drive and a strong Farymann diesel engine make the Rammax 1515 suitable for a broad range of applications. Its standard equipment includes cable remote control combinable with an optional independent infra remote control to ensure safe working and keep the operator out of the danger zone.

### Rammax 1510

The Rammax 1510 is the first articulated trench roller made by Rammax. The model completes the Rammax range of trench rollers.

It is the first time a trench roller from Rammax is able to wind like a snake through any terrain and over any material whilst simultaneously guaranteeing ideal and evenly distributed surface contact.
